Enod2 gene regulatory region - used for early expression of structural gene in developing root nodule of soybean plant.

Disclosure; page il-13; 18pp; English.

The sequences contains the Enod2a gene regulatory region (tag a) which is used to construct a recombinant DNA molecule for the early expression of structural gene in soybean root nodules. Two open reading frames are present, ORF1 and ORF2 (R04116 and R04117 resp.) but it is thought that ORF1 actually encodes the protein, N-75.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Š
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            PT - used for screening individuals for defective retino-blastoma
PT gene and treating these patients.

S Disclosure; fig 6; 71 pp; English.

C DNA encoding human retinoblastoma (RB) gene exons and flanking regions
C The CDNA (see P90599 and N90490) can be used to screen individuals
C for the presence of the mutated RB gene. The RB polypeptide
C can prevent retinoblastoma formation, and corresp. antibodies
C can be used in tumour immunodiagnosis. Refer to patent for more
S sequence analysis.details.

Hybridisation test for human papilloma virus in cell smears -
by reaction with long labelled probe specific for particular
virus types, esp. for examining cervical smears
Disclosure; ; 39pp; English.

The patent is for a rapid in situ hybridisation assay for detecting and
typing human papilloma virus (HPV) in non-frozen cellular smears fixed t
a support in absence of aldehyde-based crosslinking reagents. The assay
                                                                                                                                                                                                                                   06-APR-1989.

Fragment containing rat lipocortin
recombinant rat lipocortin; rat abo
                                                                                                                                                                                                                                                      Tuber-specific expression cassette - for prodn. of transgenic potato plants.

Disclosure; p; German.

1.527 kb Drai/Drai fragment of the patatin B33 promoter (+14 to -151 was inserted into plasmid pBI 101, next to the coding region of beta-glucuronidase and a poly-A containing nopaline-synthase termina The resultant expression cassette pBI 101 B33 was transferred to an agrobacterium (LBA 4404) which was used to infect potato leaves. sequence 1975 BP; 690 A; 265 C; 310 G; 710 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprises: (1) combining nucleic acid in the sample with at least one detectable probe able to hybridise with 1 or more HPV types; and (2) detecting presence or absence of hybrid complexes. Opt. several probes are used, eg one for HPV types 6 and 11, associated with benign warts, and one for types 16, 18, 31, 33 and 35, associated with cervical cancer. The assay can differentiate between HPV types. It is esp. used as a secondary test. The probes can be synthesised or cloned. Sequence 774 BP; 270 A; 132 C; 163 G; 209 T;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               claimed. mRNA was isolated from rat abdominal dropsy cells and synthesised from it. Probes were synthesised according to the partial amino acid sequence of rat lipocortin (see N82038 and N82039). These were used to isolate plasmids conty the desired sequence of lipocortin DNA.

New peptide(s) with immunological properties of HIV-2 envelope protein having the structure of similar immune deficiency virus proteins, useful in diagnosis and of vaccine components

Disclosure; Fig 1A; 86pp; French.

The SQ in n80859 was deposited on 21/2/86 at the CNCM under number I-522, reference name LAV-II ROD. It is the cDNA to HIV-2 ROD genomic RNA. SQ was compared with the SQ of the genome of SIV (Mac) (n80860) to identify
                      cds
                                                       cds

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Probab. P80884, P81854, P81855, P81856, P81857, P81859. PRI PROBAB. PRINCIPLE PRI NEW VARIANTS OF Lymphadenopathy associated virus (LAV) - Used for produ. of DNA, antigens and antibodies used in PT diagnosis of AIDS and pre-AIDS PT diagnosis of AIDS and pre-AIDS PT diagnosis of AIDS and pre-AIDS PS CLAIM 3; Fig 7A-7J; 72pp; English.

CC LAV ELI (n80436) and LAV MA L (n80437) were isolated from the peripheral blood lymphocytes of patients. The different AIDS virus isolates of the DNA sequences can be used for detection of the new LAV viruses or CC related viruses or DNA proviruses in eg biological samples. The proteins of repetides can be used for detection of antibodies induced in vivo and CC present in biological fluids. The DNA can also be used for the expression of LAV virus antigens for the produ. of antibodies for the CC detection of proteins related to the LAV viruses, partic. for diagnosis of AIDS or pre-AIDS.

The sequence encodes the gag protein of a new HIV-2 virus genome is infectious for human T4-lymphocytes. Abs and probes may be raised, useful in HIV-2 vaccination and diagnosis respectively. See also N70886, N70886, N70888-89, P70550-53.

R Nucleic acid probes - specific for r-RNA or r-DNA of Chlamydia PT trachomatis, useful in hybridisation assay for detection of e.g. PT trachomatis, useful in hybridisation assay for detection of e.g. PT sexual transmitted diseases.

PS Claim 3; Page 32; 35pp; English.

CC The probe is one of nine 16S rRNA-targeted probes which are specific to Chlamydia trachomatis bacteria. It may be used in a variety of cassay systems to detect e.g. respiratory, ocular or sexually creamitted diseases. See also Q10092 and Q10094-Q10110.

Combinations of soluble T4 protein and anti-retroviral agent -
Combinations of soluble T4 protein and prevention of AIDS,
                       having synergistic activity in treatment and prevention of AIDS, ARC and HIV infection.

ARC and HIV infection.

Disclosure; fig 2; 100pp; English.

Soluble T4 constructs may be produced by truncating this sequence, remove the transmembrane and intracytoplasmic domains whilst retain the extracellular region responsible for HIV binding. The sol. T4 in combined with an anti-viral agent such as AZT.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The sequence shows the sequence of the C-terminus of the superoxide dismutase (SOD)-C100 fusion polypeptide. The sequence encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANBH). The CDNA can be used to design probes, or to synthesise polypeptides, which are used to disgnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines raise attree b shows the SOD C-terminal; c shows an adaptor; d shows the NANBH polypeptide; and e shows an extra sequence. PT Transient expression system for recombinant proteins -
PT comprising eukaryotic host cell transfected with vector
PT encoding trans-activating protein and expression vector
PS bisclosure; '44 pp; English.

CC Expression vector pF8CIS contains the cytomegalovirus enhancer and prom-
Expression vector pF8CIS contains the cytomegalovirus enhancer and prom-
CC enter, the cytomegalovirus splice donor site and a portion of an intron,
CC enter of the Ig variable region intron and splice acceptor site, the cDNA encoding
CC prodn. of a desired heterologous protein in a eukaryotic host cell with a vector
CC The method comprises: transfecting a eucaryotic host cell with a vector
CC an expression vector having a sequence of a ds DNA comprising, a
CC encoding trans-activating protien; transfecting the host cell with
CC stabilising sequence downstream of a promoter and upstream of a DNA
CC encoding the amino acid sequence of the desired protein, and a poly-
CC The pref. host cells are human embryonic kidney cells (293) or JW2.
CC The method provides useful quantitites of a desired protein in a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       г

PT Transient expression system for recombinant proteins -
PT comprising eukaryotic host cell transfected with vector
PT encoding trans-activating protein and expression vector
PS Disclosure; ;44 pp; English.

CC Expression vector pF8SCIS contains the SV40 enhancer and promoter, the
CC Expression vector pF8SCIS contains the cDNA encoding factor VIII and the
CC intron and splice acceptor site, the cDNA encoding factor VIII and the
CC intion and splice acceptor site, the cDNA encoding factor VIII and the
CC SV40 polyadenylation and transcription termination sites.

CC desired heterologous protein in a eukaryotic host cell with a vector
an expression vector having a sequence of a ds DNA comprising, a
CC encoding trans-activating protein; transfecting the host cell with
CC stabilising sequence downstream of a promoter and upstream of a DNA
CC encoding the amino acid sequence of the desired protein, and a poly-
CC The pref. host cells are human embryonic kidney cells (293) or JW2.
CC The method provides useful quantitites of a desired protein in a
CC relatively short period of time without having to establish continuous
CC specific vector components and certain trans-activating proteins.

SC Specific vector components and certain trans-activating proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                RESULT

                                                                                                                                                                                                             wpI; 89-30934/42.

New luminescent chimeric proteins - useful in highly sensitive immunoassays, eg for HIV immunoassays, eg for HIV English.

Disclosure; page 35; 79pp; English.

Osed to express the chimeric variable 4-hydroxy-3-nitrophenyl (NP) used to express the chimeric variable antigen/aequorin protein, in J558L myeloma or other cells expressing antigen/aequorin protein, in J558L myeloma or other cells expressing antigen/aequorin protein, in J558L myeloma or other cells expressing antigen/aequorin protein is used as a diagnostic.

lambda 1 light chain. This protein is used as a diagnostic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Monoclonal antibody to Pseudomonas aeruginosa - and DNA coding for variable antibody regions.

Variable antibody regions.

Claim 1; page 6; 7pp; german.

The sequence has a variable and constant region. Monoclonal antibody 6A4 reacts with the OMP-1 protein of all 19 known serotypes of P.aeruginosa. reacts with the OMP-1 protein of all 19 known serotypes of acarrier for It is used for therapy and diagnosis of infection, and as a carrier for drugs. The antibody is 1962a subclass.

DNA sequence of the V and J regions of the anti-Tac heavy chain.
Anti-Tac monoclonal antibody; heavy chain; V region; J region;
interleukin-2 receptor; human T-cells; chimeric antibody.
                                                                                                         New interleukin-2 receptor-specific chimeric antibodies -
treating T-cell mediated disorders.

treating T-cell mediated disorders.

Disclosure; Fig. 2; 46pp; English.
The anti-Tac heavy chain is produced by ATCC CRL 9688. It
mouse/human chimeric antibody, which is specifically react
interleukin-2 receptors on human T-cells.

Recombinant protein mfr. - using balanced inductive control system, esp. for mfg.tissue plasminogen activator. Disclosure; fig. 3; 48pp; English.

The EIK variant of t-PA is described in EP-199574 and is characterised by substitutional mutations that eliminate a proteolysis site. Plasmid pCT-eik.2 cotains CMV enhancer/promoter region, the Ig splice acceptor, the Sp6 promoter and RNA start, the T7 promoter, the TrpE leader RBS, the altered preprot-PA gene and the SV40 polyA site.

altered preprot-PA gene and the SV40 polyA site.

altered preprot-PA gene and the SV40 polyA site.

Nucleotide sequence of gene encoding mature T4 sequence of plasmid pBG393

including soluble T4-like (sT4) polypeptide number 8 (sT4#8)

HIV; soluble T4-like polypeptide 8; immunotherapeutic; prophylactic;

plasmid pBG393; diagnostic.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              DNA sequences coding for soluble T4-like polypeptide(s) - used in immuno:theraputic and immunosuppressive compsns. and for preventing, treating or detecting AIDS Disclosure; 207pp; English.

It is the nuclectide sequence of the plasmid pBG396. The sequence was isolated from 2 libraries: a landa gt coDNA library derived from T cell tumour line REX and a landa gt10 cDNA library derived from peripheral blood lymphocyes (PBL). For screening, a series of chemically synthesised antisense oligonuclectide DNA probes based on the known T4 protein screening as series.

Disclosure; p; English.

PPC is in the anaplerotic function of the cell,

PPC in the cell indirectly increases biosynthetic

by increasing oxaloacetate levels, it indirectly increases biosynthetic

levels of L-AAs.

                                                    PT Recombinant DNA encoding gastrin - also comprising promoter and signal peptide coding regions, inserted into shuttle vector to produce PT gastrin in yeast or E.coli.

PS Claim; page 524 and fig 2: 10pp; Japanese.

CC The recombinant DNA effectively produces gastrin in high quantities.

CC The recombinant DNA effectively produces gastrin into a shuttle CC vector which can grow in yeast or E.coli, eg pAM62, CV37, pAT77, YEP51, CC YEP52 or pjDB218. The DNA encoding signal peptide is, eg from human CC gastrin, MFalphal (yeast secretion hormone), yeast invertase, killer CC toxin, yeast alkaline or acid phosphatase, human alpha-cc amylase or human trypsin inhibitor. DNA encoding gastrin is from, eg H653. See also P90331. Misc. feature d is Sau3A site, e is Sau3A site, g is PvuII site, h is HindIII site, i is Sau3A site.

CC fis HindIII site, g is PvuII site, h is HindIII site, i is Sau3A site, and j is Sau3A site. The CDS is minus the intron.

CC Bases 262-318 encode signal peptide, and bases 319-429 encode gastrin.

It is the sequenced portion of a 3.9kb HindIII fragment encoding human CSF-1 sequences. It is used in the mfr. of a compsn. useful for enhancing prodn. of white blood cells, including neutrophils, from stem cells. It is also used in mfr. of a compsn. useful for treatment/ prophylaxis of bacterial or viral infectious diseases (esp. cytomegalovirus or Gram-negative sepsis), for the treatment of sarcoma or melanoma, for stimulating antibody-dependent cellular cytotoxicity (ADCC), and for wound healing.

Recombinant polynucleotide(s) encoding glucose oxidase and vectors conty. them, secreting glucose oxidase or hyper-glycosylated analogues into medium Disclosure; B-6; 108pp; English.

Disclosure; B-6; 108pp; English.
        The cDNA can also be used to isolate GO-encoding sequences from other sources. Its encoded GO is used in desugaring eggs, removing oxygen from moist food prods, beverages, flavours and hermetically-sealed food packages, and in detection and estimation of glucose in industrial solr and body fluids, eg blood and urine. This sequence is the same as that given in Fig 5B of the patent, but with the addition of one Guanine at the start of the sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         1223
